

The Flow You Should Follow

1. Start with the Roadmap

Open the roadmap first. Don't skip this step. It tells you exactly what to learn, in what order, and how much time to spend. If you only follow this one file consistently, you'll already be ahead of most people.

2. Use the Core Resources

Inside you'll find notes, eBooks, and cheat sheets. These aren't meant to be read like novels. Use them as quick references while you learn and practice. For example, if you're stuck on a Git command, check the Git cheat sheet — don't waste half an hour searching online.

3. Start Projects Early

Don't wait until you've "finished learning." Start with the smaller projects in the Projects folder as soon as possible. Even a simple Dockerized app or a basic CI/CD pipeline shows more proof of skill than months of just reading. Projects are what you'll talk about in interviews, not theory.

4. Prepare for Interviews in Parallel

Once you're comfortable with the basics, start looking at the Interview Prep folder. Don't cram it all at the end. Do 5–10 questions every week. This way, by the time you sit for interviews, nothing feels new or overwhelming.

5. Polish Your Resume and Portfolio

The Career Toolkit is where most people slip up. You can be technically good, but if your resume looks messy or your GitHub is empty, recruiters won't bother. Use the templates and examples here — they're built to get past ATS filters and make your profile stand out.

6. Don't Just Wait for Jobs — Go After Them

The Job Hunt Accelerator folder gives you ready-made outreach messages, email scripts, and job board links. Use them. Most freshers send boring, copy-paste "Please hire me" messages. Yours will stand out because they're direct and professional.

Final Advice

If you open everything at once, you'll get overwhelmed. The right way is:

Roadmap → Resources → Projects → Interview Prep → Career Toolkit → Job Hunt.

Follow that order. Do one stage at a time, and don't move forward until you've at least touched the basics of the current stage.

This is not about "studying forever." It's about learning enough to build, showing proof through projects, and then putting yourself out there for opportunities.

Every file in this SkillStack is here for a reason. Use it properly, and in a few months you'll have both the skills and the confidence to land interviews.
